

# **PREDICTING SUICIDAL EXPERIENCES AMONG YOUTH EXPERIENCING HOMELESSNESS (YEH): STRIVING FOR STABILITY, ACCURACY, AND FAIRNESS**

Anthony Fulginiti, PhD, MSW

Associate Professor, Graduate School of Social Work

University of Denver

# HOMELESSNESS & SUICIDAL EXPERIENCES

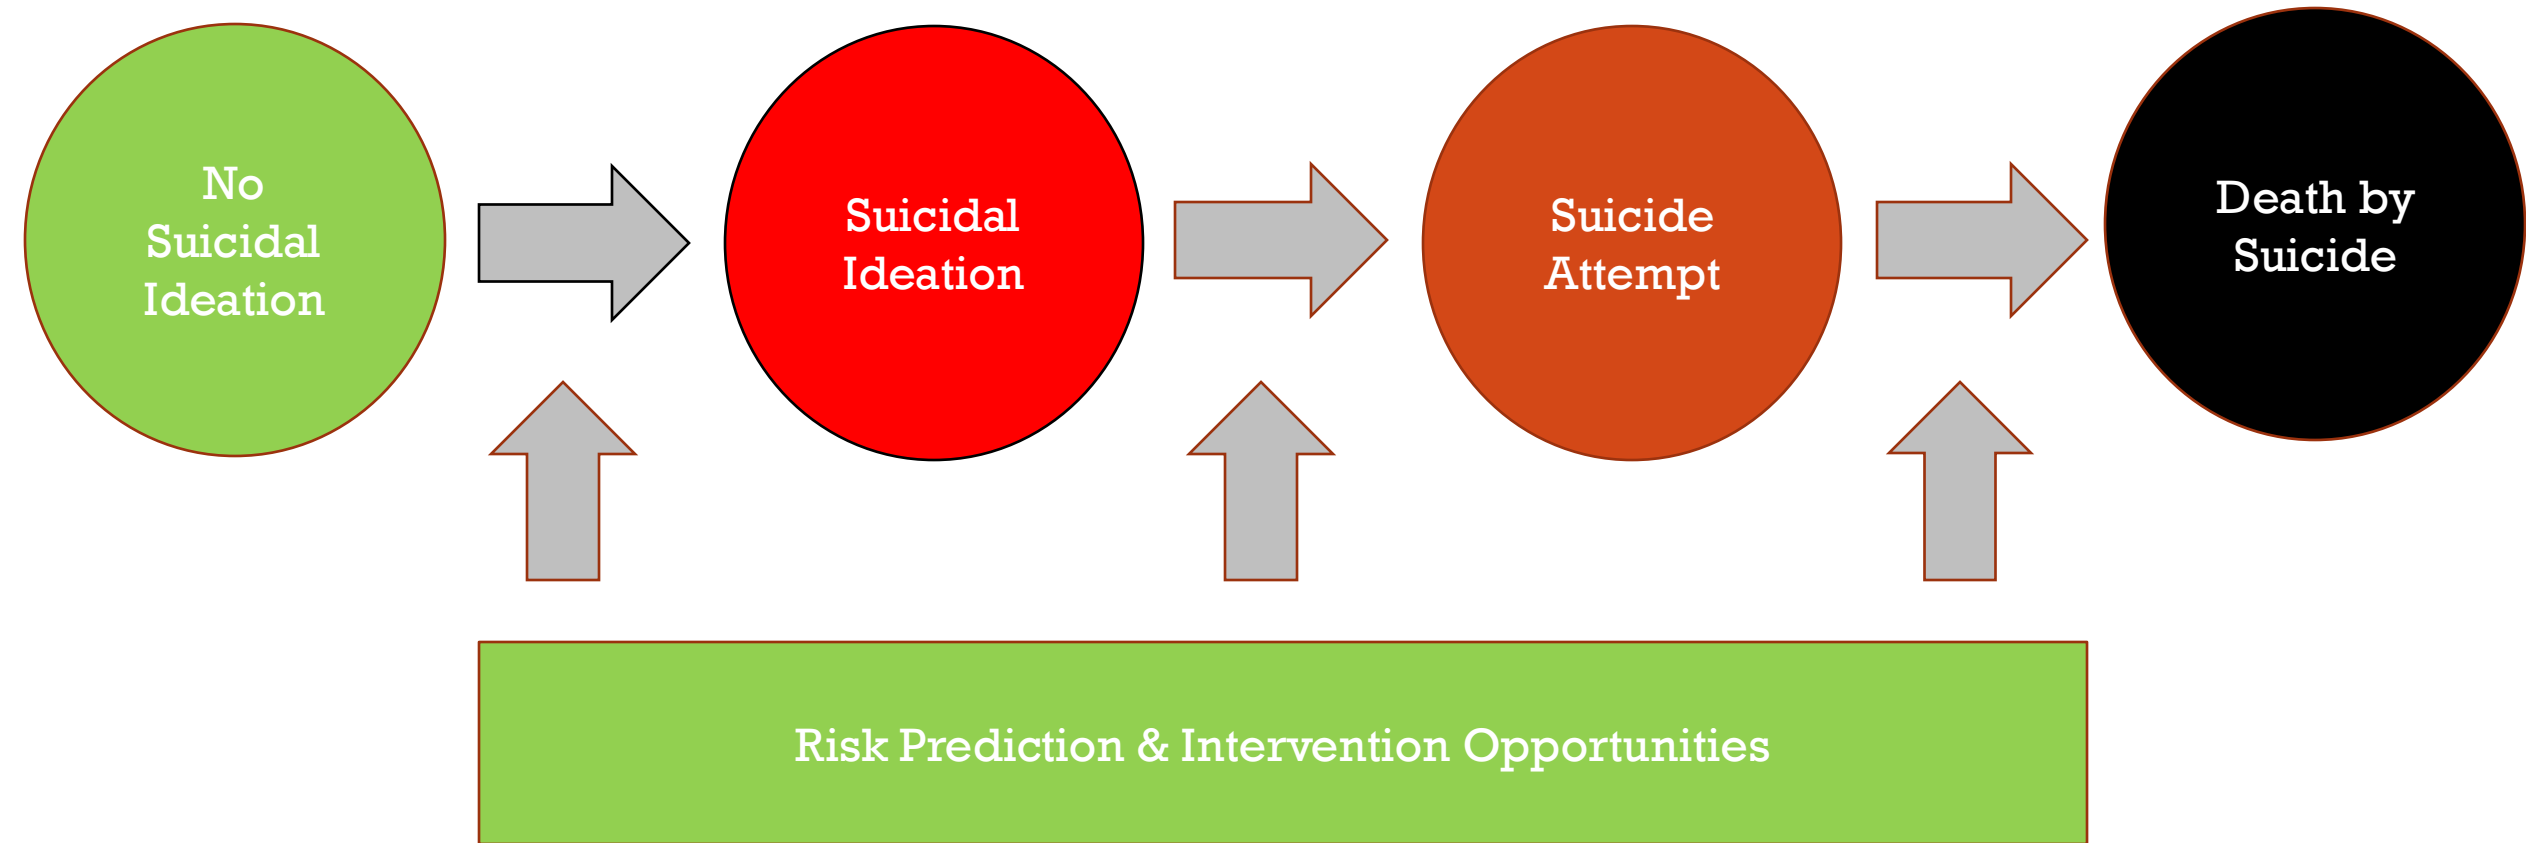

- ~4.2 million youth experience homelessness each year in the U.S.
- Lifetime rates of suicidal ideation: ~40%
- Lifetime rates of suicide attempts: ~35%
- Past-year rates of suicidal ideation: ~30%
- Past-year rates of suicide attempts: ~20%

<http://www.nekys.org/homeless-youth/>

# TYPICAL SUICIDAL PROCESS

# SUICIDE PREDICTION IS HARD!!!

<https://www.inc.com/will-yakowicz/4-predictions-to-avoid-while-assessing-competitors.html>

# PERSON-CENTRIC VIEW OF SUICIDE: EXAMPLE CORRELATES OF SI & SA

Age (Younger = higher risk)

Gender (Female = higher risk)

Depression

Substance Use

History of Trauma

Post-traumatic Stress

## A SOCIOECOLOGICAL VIEW OF SUICIDE: THE ENVIRONMENT MATTERS

# SOCIOECOLOGICAL VIEW OF SUICIDE: EXAMPLE CORRELATES OF SI & SA

## RELATIONSHIP FACTORS

Social support

Contagion

Relational Conflict/Victimization

Coping Norms

## COMMUNITY/SOCIETAL FACTORS

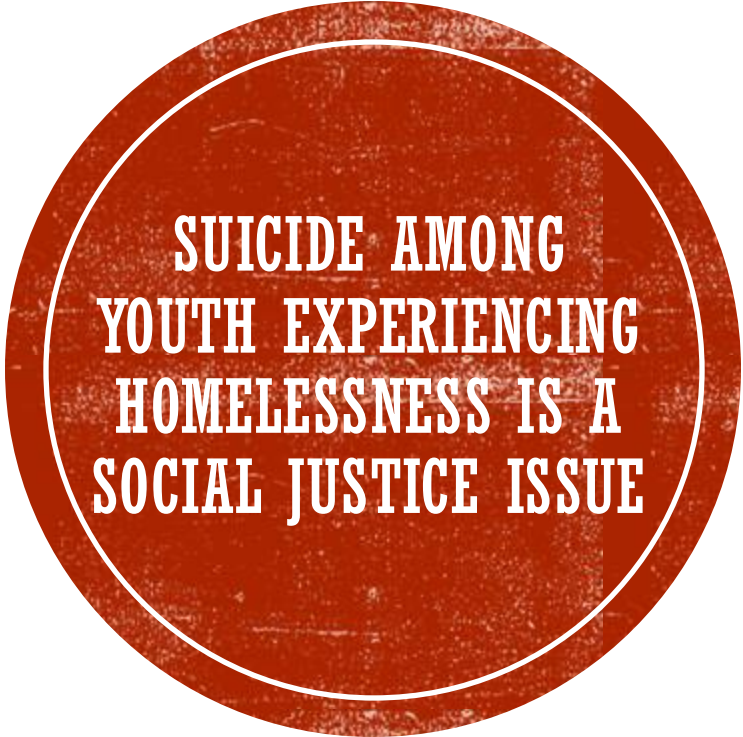

Socioeconomic Disadvantage

Inadequate/Inaccessible Healthcare

Discrimination & Social Exclusion

Historical Trauma

**SUICIDE AMONG  
YOUTH EXPERIENCING  
HOMELESSNESS IS A  
SOCIAL JUSTICE ISSUE**

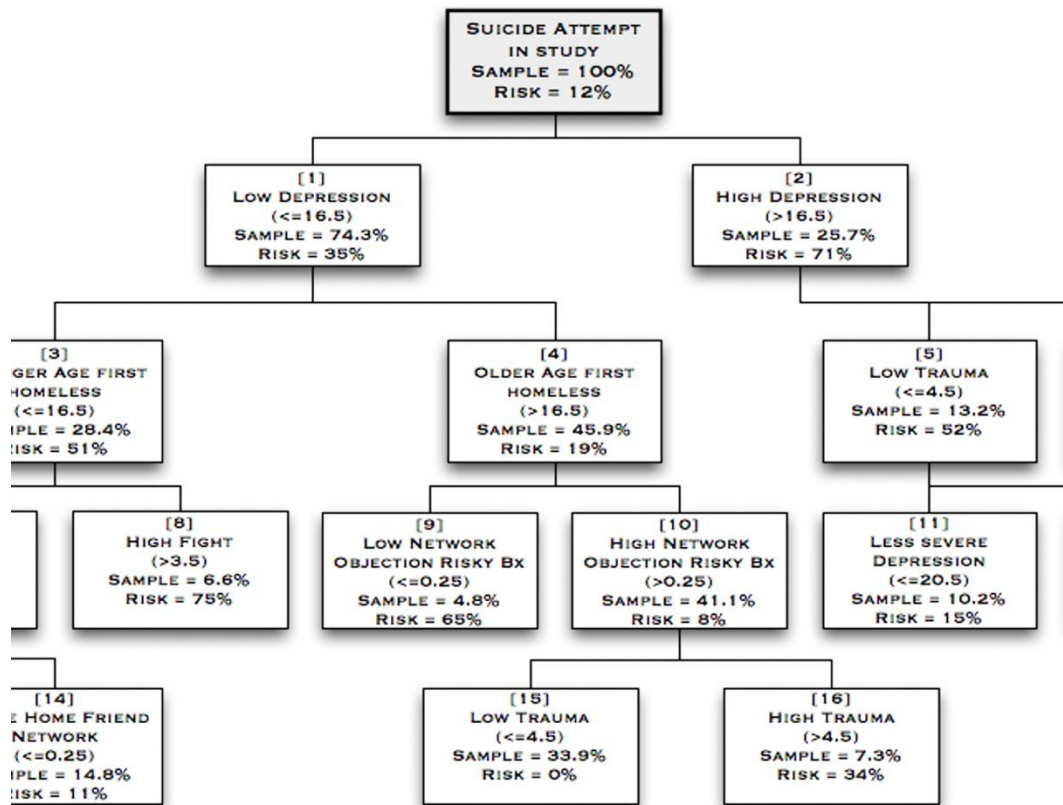

**Suicide-Related Disparities  
Among YEH**

**Suicide-Related Disparities  
Among Youth with Minoritized  
Identities (e.g., gender and sexual  
minorities)**

**Youth with Minoritized Identities  
(e.g., racial/ethnic, gender, and  
sexual minorities) are  
overrepresented among YEH**

# EFFORTS TO IMPROVE PREDICTIONS: ITERATION 1

- We included both personal and social environment characteristics into our prediction models
- We used decision tree analyses (specifically CART models) to account for complex interactions and produce results that are more interpretable to guide service delivery

# WHAT WERE THE RESULTS OF OUR DT MODELS?

- Suicidal Ideation
  - AUC: .79
  - Sensitivity: 48%
  - Specificity: 73%
- Suicide Attempts
  - AUC: .86
  - Sensitivity: 68%
  - Specificity: 72%
- Literature Comparison
  - Median/Mean AUC = .76/.78

# ITERATION 1: LIMITATIONS

- We used a train-split approach: a single split was used to create the training and testing datasets (80:20) for our decision-tree models. This raised questions about the robustness of the model performance.
- The majority of youth did not have suicidal experiences, but we did not account for class imbalance issues when making predictions.
- We did not test whether predictions were fair across different gender, sexual orientation, and racial/ethnic groups.

[https://portlandenglish.edu/pela-blog/have-or-be/question-mark-1421013\\_1280/](https://portlandenglish.edu/pela-blog/have-or-be/question-mark-1421013_1280/)

# ITERATION 2: SUMMARY & CHALLENGES

- This problem was presented in this class several years ago and efforts were made to address the limitations of iteration 1.
- Although k-fold cross validation was used to better evaluate the robustness of the overall model performance, the individual surrogate models were substantially different from one another (e.g., different constituent features).
- Although it is common to have different feature/variable sets across individual trees when using ensemble methods (e.g., random forests), such differences can make it more challenging to interpret the results for applied purposes (e.g., treatment/program planning)
- Is it possible to develop a model that can produce more interpretable results (i.e., stability of features across individual trees) while also delivering accurate and fair predictions?

[https://portlandenglish.edu/pela-blog/have-or-be/question-mark-1421013\\_1280/](https://portlandenglish.edu/pela-blog/have-or-be/question-mark-1421013_1280/)

# OVERARCHING PROJECT AIMS

1. Increase the stability of feature/variable sets across individual surrogate trees
2. Increase the accuracy of our predictions related to suicidal experiences (e.g., sensitivity/specificity)
3. Improve the fairness of our predictions related to suicidal experiences across gender, sexual orientation, and racial/ethnic identities

<https://www.searchenginejournal.com/seo-goals/285965/#close> <https://www.searchenginejournal.com/seo-goals/285965/#close>

# IMPLICATIONS OF THE PROJECT

- Decision trees that produce accurate suicide-related predictions can lead to more effective suicide risk management
- Although ensemble methods are generally preferred to improve predictions, such methods can introduce challenges for interpretability. Finding a way to improve prediction accuracy while maintaining interpretability may help to inform suicide prevention programming, resource allocation, and perhaps even aid theory development
- Striving for fairness in our decision tree predictions is a social justice action that ensures we are not compounding the suicidogenic effects of inequity.

<https://www.nuveen.com/en-us/insights/fixed-income-impact-investing/impact-framework-methodology>

# DESCRIPTION OF THE PROJECT DATASET

- Sample size = 940
- Data were collected as part of project designed to understand HIV/AIDS risk-taking behavior among young people experiencing homelessness.
- Data collection occurred between October 2011 and February 2013
- Recruited from two drop-in centers that serve young people experiencing homelessness in Hollywood and Santa Monica, CA.
- Survey + Social Network Interview

<https://www.linkedin.com/pulse/seven-key-characteristics-project-stanley-epstein/>

# PROSPECTIVE DEPENDENT VARIABLES

- Active Suicidal Ideation (*label= suicidea*)
  - “During the past 12 months, did you ever seriously consider attempting suicide?”
  - Coded: 0= No and 1= Yes
- Suicide Plan (*label= suicplan*)
  - During the past 12 months, did you make a plan about how you would attempt suicide?
  - Coded: 0= No and 1= Yes
- Suicide Attempt (*label= suicattempt*)
  - “During the past 12 months, how many times did you actually attempt suicide?”
  - Coded: 0= No Attempts and 1=  $\geq 1$  Attempt
- Any Suicidal Experience (*label= suic\_any*)
  - Coded: 0= No and 1= Yes

<https://www.bhsarkansas.org/about/news-events/national-suicide-prevention-month>

# INDEPENDENT VARIABLES: PERSONAL CHARACTERISTICS

- 47 variables that assess personal attributes
- Sociodemographic factors (e.g. education)
- Mental health factors (e.g., depression, trauma)
- Substance use (e.g., alcohol, marijuana, hard drug use),
- Sexual risk behaviors (e.g., # sex partners),
- Violence perpetration and victimization (e.g., weapon-carrying, IPV victim),
- Justice system involvement (e.g., spending time in jail; Harris et al., 2009),
- Online activity (e.g., time spent online)
- Homelessness indices (e.g., time spent homeless; age first homeless).

# INDEPENDENT VARIABLES: SOCIAL NETWORK CHARACTERISTICS

- 74 variables that assess social network attributes
- Two types of variables---proportion and sum scores---were derived for each network attribute (i.e., 37 unique network attributes measured in two different ways)
- Relationship types (i.e., family, friends, intimate partners, home-based peers, street-based peers)
- Frequency of contact
- Substance use behavior (e.g., hard drug use)
- Sexual risk behavior (e.g., unprotected sex)
- Social support provision (e.g., emotional or tangible support)
- Encouragement/rejection of risky behavior
